2 NOVEMBER 2026

CLASS 01 NOTES

Machine Learning in 2026, and how these two months run

01	Where ML already runs today
02	What the next five years look like
03	The question: if AI can write code, why learn this?

Machine Learning: Build → Understand → Deploy

31 live classes // 2 November – 29 December 2026

learn.rajeevshivah.me

CLASS 01 · 01

CLASS 1 // MON 2 NOV // STARTS 8:30 PM

MACHINE LEARNING *IN 2026*

31 live classes // 2 Nov to 30 Dec // codeWithShivah

While you wait: say hello in the chat — your name, your city, and one thing you want to build.

CLASS 01 · 02

200,000,000

protein structures predicted *in about a year*.

In the fifty years before that, every laboratory on earth put together had solved roughly 190,000. One structure could take a PhD student three years.

So what changed?

CLASS 01 · 03

A model is reading a chest X-ray in a district hospital *right now* — in a place where no radiologist works.

Machine learning is not a thing that is coming. It is already deployed, already making decisions about people, already in production.

CLASS 01 · 04

IT IS ALREADY RUNNING, TODAY

Medicine
Diabetic retinopathy screened from a phone camera in rural clinics. **Predicts:** does this retina show disease?

Money
Every UPI transaction is scored for fraud before it completes. **Predicts:** is this payment genuine?

Language
Live translation, speech to text, the autocomplete you used this morning. **Predicts:** what word comes next?

Mobility
Your cab ETA, the route it chose, the surge price you paid. **Predicts:** how long will this trip take?

Notice the pattern. Every single one is a prediction made from past data.

CLASS 01 · 05

WHAT THE NEXT FIVE YEARS LOOK LIKE

- **Drug discovery** — candidate molecules screened in weeks instead of years
- **Education** — a syllabus that adapts to the student instead of the class average
- **Agriculture** — yield and disease predicted per field, from satellite images
- **Diagnostics** — first-level screening in every primary health centre
- **Software** — most boilerplate code written by a model, reviewed by a human

> Every one of those needs someone who can take messy real data and turn it into a model that can be trusted. That is the job. That is what we are training for.

CLASS 01 · 06

"If AI can write code, *why am I learning this?*"

Let me answer it honestly, in the first class, instead of pretending nobody is thinking it.
